ABSTRACT

The **Tomato Food Delivery Website** is a web-based application designed to simplify ordering food online. The main objective of this system is to provide users with a convenient platform where they can browse restaurants, view food items, and place orders quickly and efficiently.

The system allows customers to create accounts, log in securely, explore different food categories, and add items to a cart to place orders through an easy-to-use interface. It also provides features such as order tracking, order history, and payment options. On the admin side, the system allows administrators to manage food items, update menus, monitor orders, and track sales data.

This project is developed using modern web technologies such as React for the frontend, **Node.js for the backend**, and a database to store user information, orders, and product details. The website is designed to be responsive so that users can access it easily from desktops, tablets, and mobile devices.

The Tomato Food Delivery Website improves customer convenience, reduces manual order processing, and provides an efficient way for restaurants to manage online food delivery services.

1. Problem Background

In today's fast-paced lifestyle, people often face difficulties in finding time to cook or visit restaurants to order food. Traditional food ordering methods require customers to physically visit restaurants or place orders through phone calls, which can be time-consuming and inefficient. These methods also create problems such as long waiting times, order mistakes, and a lack of proper order tracking.

Many small restaurants still rely on manual systems to manage orders, which makes it difficult to keep track of customer requests, delivery status, and sales records. This manual approach can lead to poor customer experience and operational inefficiencies.

With the rapid growth of internet technology and smartphones, online food delivery platforms have become an effective solution to these problems. A web-based food ordering system allows customers to easily browse menus, place orders, and track deliveries from anywhere at any time.

The **Tomato Food Delivery Website** is developed to address these issues by providing a centralized platform where customers can order food online, and restaurants can efficiently manage their orders. The system aims to reduce manual work, improve order accuracy, and provide a convenient and user-friendly experience for both customers and restaurant administrators.

1. Objective of the Project

The main objective of the **Tomato Food Delivery Website** is to develop an efficient and user-friendly online platform that allows customers to order food easily and enables restaurants to manage orders effectively. The project aims to simplify the food ordering process and improve the overall customer experience.

- a. **Provide an Online Food Ordering Platform** To develop a web-based system where users can browse food items and place orders online without visiting the restaurant.
- b. **User-Friendly Interface** To design a simple and interactive interface so that customers can easily navigate through menus and select food items.

- c. **Efficient Order Management**To allow administrators to manage food items, update menus, and monitor customer orders efficiently.
- d. **Cart and Payment System**To enable users to add multiple items to a cart and proceed with the order through a secure payment or checkout system.
- e. **Order Tracking and History**To provide customers with order tracking and allow them to view their previous order history.
- f. **Responsive Web Design**To ensure that the website works smoothly on different devices such as desktops, tablets, and smartphones.
- g. **Improve Restaurant Efficiency**To help restaurants manage their orders digitally and reduce manual errors.

1. Proposed Solution / System Overview

The proposed solution is the development of a **Tomato Food Delivery Website**, a web-based application that allows users to order food online in a simple and efficient way. The system provides a digital platform where customers can browse food menus, select items, and place orders from different restaurants without visiting them physically.

The website consists of two main modules: the **User Module** and the **Admin Module**.

a. User Module

The user module allows customers to interact with the system. Users can create an account, log in securely, browse available food items, and add selected items to their cart. After selecting the desired food items, users can place an order and view their order history. The system also provides a responsive interface so that users can access the website through mobile phones, tablets, or computers.

a. Admin Module

The admin module is designed for managing the system. The administrator can add new food items, update menus, manage orders, and monitor sales data. The admin can also track customer orders and ensure that deliveries are processed efficiently.

a. System Benefits

The proposed system helps in reducing manual work and improving the overall efficiency of food ordering and delivery services. It provides a fast, reliable, and convenient way for customers to order food while allowing restaurants to manage their operations digitally.

The system is built using modern web technologies such as **React for the frontend, Node.js for backend services, and a database system to store user, order, and product information**. This architecture ensures scalability, security, and better performance.

1. Key Features or Functionality

The **Tomato Food Delivery Website** includes several key features that make the system efficient and user-friendly. These features help customers easily order food and allow administrators to manage the platform effectively.

a. User Registration and Login

The system allows new users to create an account by providing basic details such as name, email, and password. Registered users can securely log in to access the website and place food orders.

a. Food Menu Browsing

Users can browse different food categories and view available food items with details such as price, description, and images. This feature helps customers order food easily.

a. Add to Cart

Customers can add selected food items to a shopping cart. The cart displays the list of selected items, quantity, and total price before placing the order.

a. Order Placement

After selecting food items, users can place their order by confirming the cart details. The system stores the order information in the database for processing and delivery.

a. Order History

The system allows users to view their previous orders. This feature helps customers track their past purchases and reorder items easily.

a. Admin Management

The admin can also track customers and ensure that deliveries are processed efficiently.

a. Responsive Design

The website is designed to work smoothly on different devices such as desktops, tablets, and mobile phones, ensuring a better user experience.

1. Technology / Method Used

The **Tomato Food Delivery Website** is developed using modern web technologies to ensure efficiency, scalability, and a smooth user experience. The system follows a **full-stack web development approach**, where the frontend handles user interaction and the backend manages data processing and storage.

a. Frontend Technologies

The frontend of the system is developed using **React.js**, which helps create a dynamic and interactive user interface. HTML and CSS are used to design the structure and layout of the website, while JavaScript is used to handle user interactions such as adding items to the cart and navigating between pages.

a. Backend Technologies

The backend is implemented using **Node.js** and **Express.js**, which handle server-side logic, user authentication, and communication between the frontend and the database. The backend processes user requests such as login, food ordering, and order management.

a. Database

A database system such as **MongoDB** is used to store and manage application data. The database keeps records of user accounts, food items, orders, and transaction details.

a. API Integration

RESTful APIs are used to connect the frontend and backend. APIs allow the system to send and receive data such as menu items, order details, and user information.

e. Development Tools

Various development tools are used to build and manage the project, including:

- **Visual Studio Code** for coding and development
- **Git and GitHub** for version control and project management
- **Node Package Manager (NPM)** for installing and managing dependencies

f. Method Used

The project follows a **modular development approach**, where the system is divided into different modules such as user management, food menu management, and order processing. This method makes the system easier to develop, maintain, and upgrade in the future.
